

# Drawing 1

## Existing stable with proposed flues (to scale)

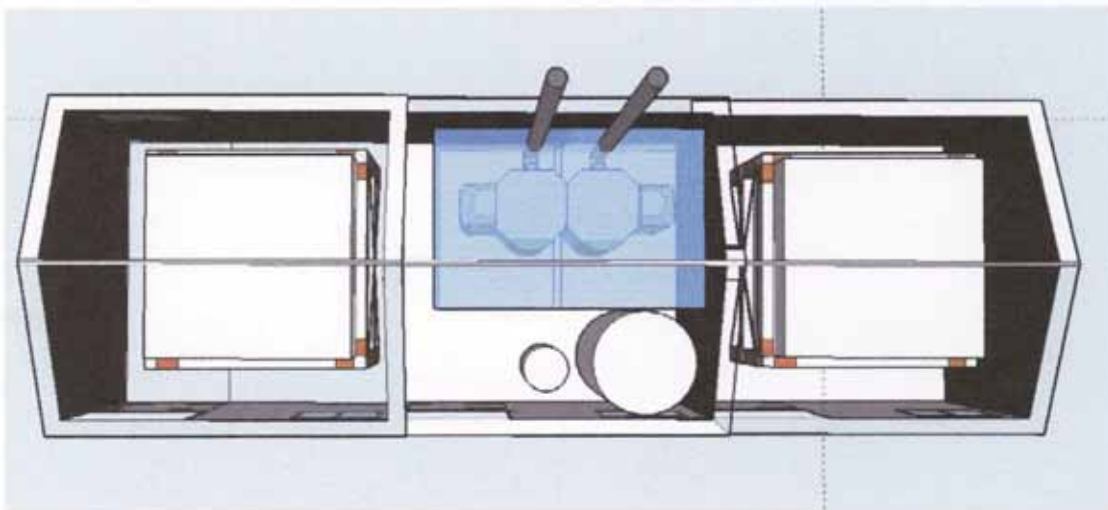

Existing stable block to the left. Proposed plant room to the right. The stable is in three stepped sections.

The plant room will house 2 x KGT2626 fuel silos in each outer section, with the boilers, accumulator tank and expansion vessel in the middle section.

The max. combined fuel capacity of the two fuel stores is 17 tonnes.

Assuming 4.5m height from spigot, the flue height will be 2.65 above ridge height.

1. NOTE: the actual flue colour will be a dark grey. These images were generated prior to that decision.
